Learn To Write In Typst

Prepared by A. Mhamdi

Typst supports Markdown syntax, which provides a range of formatting options. Here are some points to help you write your report:

1. Formatting Text:
   - Surround a text with single asterisks '(*)' to make it bold
   - Use single underscores '(_)' around your text to emphasize it
   - To create headings, use equal signs '(=)' followed by a space at the begining of a line. The number of '(=)' symbols determines the heading level.
2. Creating lists:
   - Unordered list: use a hyphen '(-)' followed by a space for each list item
   - Ordered list: use a plus sign '(+)' followed by a space for each list item
3. Code snippets:
   - Inline code: enclose the code within backticks (`)
   - Block of code: use triple backticks followed by the language you are using to enable syntax highlighting

   ```python
       import numpy as np
       from matplotlib import pyplot as plt

       plt.plot(np.sin(np.linspace(0, 2 * np.pi)))
       plt.show()
   ```

4. Inserting Objects:
   - Use this syntax if you need to insert an image:

   ```
   #figure(
     image("IMAGE_NAME.EXT", width: 100%),
     caption: [IMAGE_CAPTION],
   ) <fig:LABEL>

   @fig:LABEL shows an image.
   ```
   - Use this syntax if you need to draw a table:

   ```
   #figure(
     table(
       columns: 4,
       [Row 1], [a], [b], [c],
       [Row 2], [1], [2], [3],
     ),
     caption: [Results],
   ) <tab:LABEL>

   @tab:LABEL displays some results.
   ```
